Abstract of corresponding document: **EP0217250**

Aqueous surfactant preparations which foam well and contain 0.05 to 3 % by weight of water-insoluble oils, fats or waxes which have been solubilised to give a clear solution are prepared by mixing the oil, fat or wax (A) and a non-ionic polyethoxylated emulsifier (B), heating the mixture where appropriate above its melting point and adding an aqueous solution, which has been heated to the same temperature, of an anionic surfactant (C) and, where appropriate, amphoteric and/or zwitterionic surfactants and/or amine oxide surfactants (D). Suitable and preferred polyethoxylated emulsifiers are fatty acid C8-C18-mono- and diesters of adducts of 4 to 20 mol of ethylene oxide and glycerol or adducts of 4 to 20 mol of ethylene oxide and fatty acid C8-C18-mono-, di- and triglycerides.
